

Human Digestive System

The human digestive system helps our body break down food and absorb nutrients. These nutrients give us energy, help us grow, and keep us healthy.

◆ Main Organs

- **Mouth** – Digestion starts here. Teeth chew food and saliva mixes with it.
- **Esophagus (Food Pipe)** – Carries food from mouth to stomach.
- **Stomach** – Breaks food using acids and enzymes.
- **Small Intestine** – Absorbs nutrients into the blood.
- **Large Intestine** – Absorbs water and forms waste.

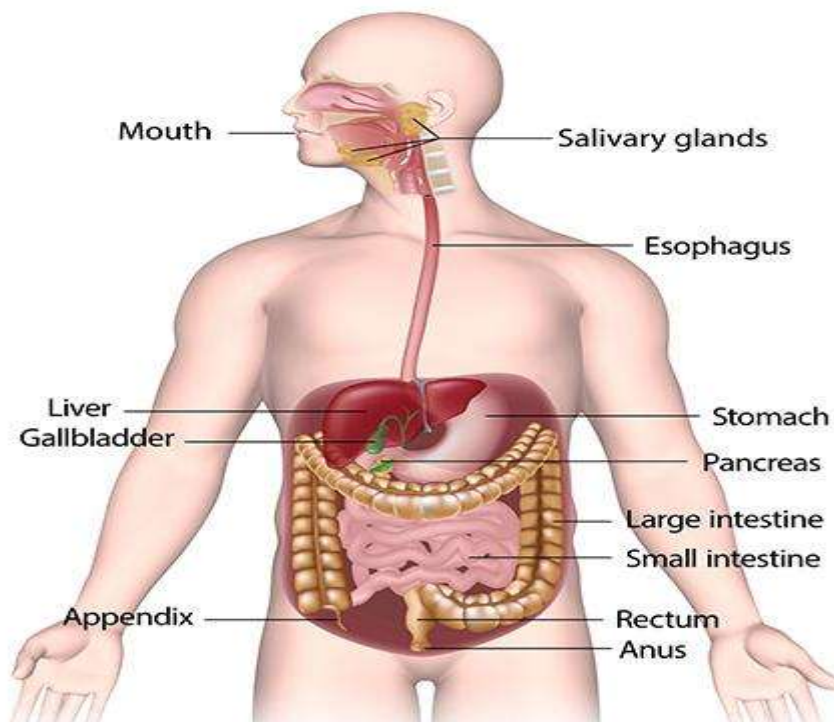

◆ Process of Digestion

1. Food enters the mouth
2. Moves to stomach through food pipe
3. Gets digested in stomach
4. Nutrients absorbed in small intestine
5. Waste removed through large intestine

★ Conclusion

The digestive system converts food into energy and nutrients needed by the body.

The Digestive System

Human Eye

The human eye helps us see the world around us. It captures light and sends signals to the brain.

◆ Main Parts

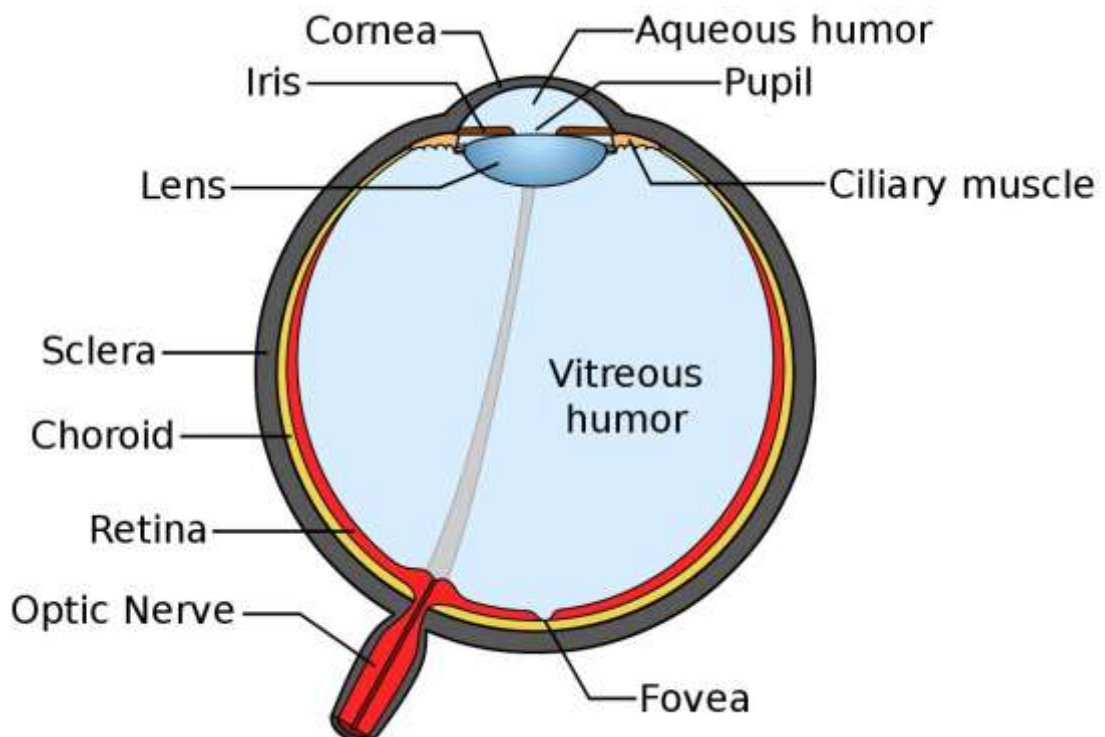

- **Cornea** – Outer transparent layer
- **Pupil** – Controls amount of light entering
- **Lens** – Focuses light
- **Retina** – Forms image
- **Optic Nerve** – Sends signals to brain

◆ How Eye Works

1. Light enters through cornea
2. Passes through pupil and lens
3. Image forms on retina
4. Brain understands the image

★ Conclusion

The eye helps us see, recognize objects, and understand our surroundings.

Human Heart

The heart is a muscular organ that pumps blood throughout the body.

◆ Functions

- Pumps oxygen-rich blood to body
- Removes carbon dioxide
- Keeps body cells alive

◆ Main Parts

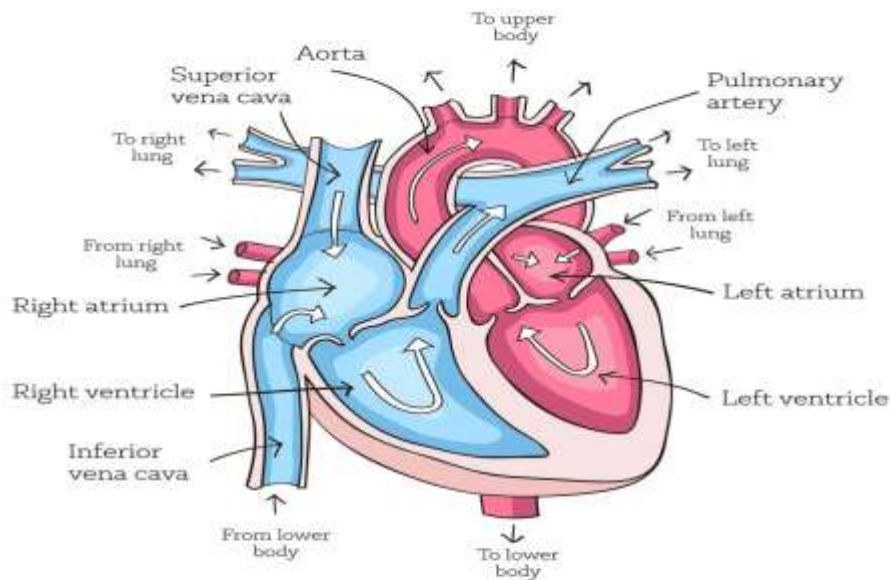

- **Atrium (upper chambers)**
- **Ventricle (lower chambers)**
- **Valves** – Control blood flow

◆ Working

- Heart beats continuously
- Blood enters → gets pumped → circulates in body

★ Conclusion

The heart is essential for life as it keeps blood moving in the body.

THE HUMAN HEART

Human Respiratory System

The respiratory system helps us breathe and exchange gases.

◆ Main Organs

- **Nose** – Takes in air
- **Trachea (Windpipe)** – Carries air
- **Lungs** – Exchange oxygen and carbon dioxide

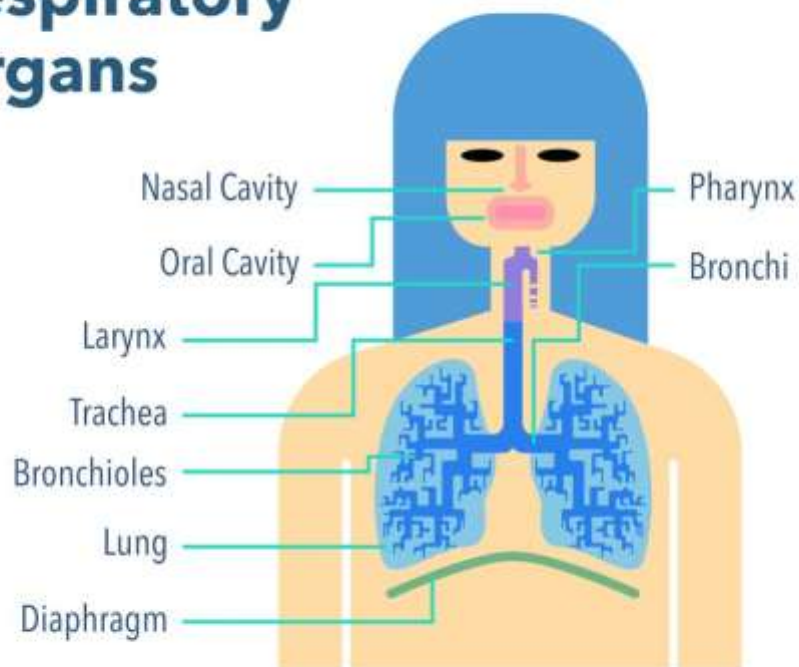

◆ Process of Breathing

1. Inhale oxygen
2. Oxygen goes to lungs
3. Carbon dioxide is removed
4. Exhale waste gases

★ Conclusion

Breathing is necessary to provide oxygen for energy production.

Respiratory Organs

Human Brain

The brain is the control center of the body.

◆ Functions

- Controls thinking and memory
- Controls body movements
- Processes information

◆ Main Parts

- **Cerebrum** – Thinking and memory
- **Cerebellum** – Balance and coordination
- **Brainstem** – Controls basic functions

★ Conclusion

The brain controls all activities of the body and helps us think and learn.

ANATOMY OF THE BRAIN
